

Lecture 3. Status of renormalons & Resurgence/Nonperturbative-OPE in QCD/YM in \mathbb{R}^4

Antonio Pineda

Universitat Autònoma de Barcelona & IFAE

VIII Parma international school of theoretical physics,
Parma, September 4-10, 2016

Renormalons

Originally (Lautrup, 't Hooft).

Renormalon: summation of "bubbles". Running of α_s .

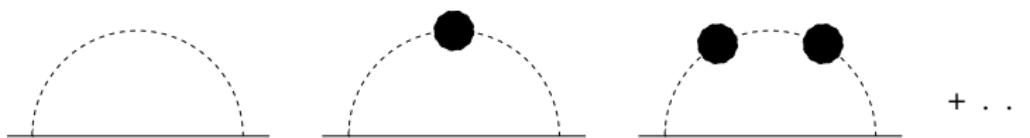

Figure: Sum of the bubbles in the quark propagator.

Pole mass (Bigi, Shifman, Uraltsev, Vainshtein; Beneke, Braun)

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \quad B_n \sim n!$$

$$\delta m \propto \int dk \alpha(k) \sim \alpha_s(\mu) \sum_{n=0}^{\infty} \left(\frac{\beta_0 \alpha(\mu)}{2\pi} \right)^n \int dk \ln^n \frac{\mu}{k} = \alpha_s(\mu) \sum_{n=0}^{\infty} \left(\frac{\beta_0 \alpha(\mu)}{2\pi} \right)^n n!$$

$$\beta_0^{\text{QED}} = -\frac{4}{3} T_F n_f \rightarrow \beta_0^{\text{QCD}} = \frac{11}{3} C_A - \frac{4}{3} T_F n_f \text{ naive non-abelianization.}$$

Beyond bubbles: renormalization group methods (Parisi; Beneke, ...)

NP OPE (Novikov, Shifman, Vainshtein, Zakharov)

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \quad B_n \sim n!$$

$$\delta m \propto \int d\mu \alpha(\mu) \sim \alpha_s(\mu) \sum_{n=0}^{\infty} \left(\frac{\beta_0 \alpha(\mu)}{2\pi} \right)^n \int d\mu \ln^n \frac{\mu}{k} = \alpha_s(\mu) \sum_{n=0}^{\infty} \left(\frac{\beta_0 \alpha(\mu)}{2\pi} \right)^n n!$$

$$\beta_0^{\text{QED}} = -\frac{4}{3} T_F n_l \rightarrow \beta_0^{\text{QCD}} = \frac{11}{3} C_A - \frac{4}{3} T_F n_l \text{ naive non-abelianization.}$$

Beyond bubbles: renormalization group methods (Parisi; Beneke, ...)

NP OPE (Novikov, Shifman, Vainshtein, Zakharov)

Modern view: EFT/Factorization

$$\mathcal{L} = \sum_n \frac{1}{m^n} c_n O_n \quad c(\nu) = \bar{c} + \sum_{n=0}^{\infty} c_n \alpha_s^{n+1}.$$

The Wilson coefficients are believed to be asymptotic: $c_n \sim n!$

If so such behavior should comply with the Operator Product Expansion.

EFT/factorization definition of renormalon: Asymptotic behavior of the perturbative expansion such that the associated ambiguity in the summation of the perturbative series can be absorbed into a higher order operator.

Example:

$$M_B = m_{\text{OS}} + \bar{\Lambda}_B + \mathcal{O}(1/m_{\text{OS}})$$

M_B is renormalon free. Therefore m_{OS} suffers from renormalon ambiguities:

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots)$$

with $B_n \sim n!$. In other words

$$\delta_{np}^{(\text{pert.})} m_{\text{OS}} = \delta_{np}^{(\text{pert.})} m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \sim \Lambda_{\text{QCD}}!$$

Modern view: EFT/Factorization

$$\mathcal{L} = \sum_n \frac{1}{m^n} c_n O_n \quad c(\nu) = \bar{c} + \sum_{n=0}^{\infty} c_n \alpha_s^{n+1}.$$

The Wilson coefficients are believed to be asymptotic: $c_n \sim n!$

IF SO such behavior should comply with the Operator Product Expansion.

EFT/factorization definition of renormalon: Asymptotic behavior of the perturbative expansion such that the associated ambiguity in the summation of the perturbative series can be absorbed into a higher order operator.

Example:

$$M_B = m_{\text{OS}} + \bar{\Lambda}_B + \mathcal{O}(1/m_{\text{OS}})$$

M_B is renormalon free. Therefore m_{OS} suffers from renormalon ambiguities:

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots)$$

with $B_n \sim n!$. In other words

$$\delta_{np}^{(\text{pert.})} m_{\text{OS}} = \delta_{np}^{(\text{pert.})} m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \sim \Lambda_{\text{QCD}}!$$

Modern view: EFT/Factorization

$$\mathcal{L} = \sum_n \frac{1}{m^n} c_n O_n \quad c(\nu) = \bar{c} + \sum_{n=0}^{\infty} c_n \alpha_s^{n+1}.$$

The Wilson coefficients are believed to be asymptotic: $c_n \sim n!$

IF SO such behavior should comply with the Operator Product Expansion.

EFT/factorization definition of renormalon: Asymptotic behavior of the perturbative expansion such that the associated ambiguity in the summation of the perturbative series can be absorbed into a higher order operator.

Example:

$$M_B = m_{\text{OS}} + \bar{\Lambda}_B + \mathcal{O}(1/m_{\text{OS}})$$

M_B is renormalon free. Therefore m_{OS} suffers from renormalon ambiguities:

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots)$$

with $B_n \sim n!$. In other words

$$\delta_{np}^{(\text{pert.})} m_{\text{OS}} = \delta_{np}^{(\text{pert.})} m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \sim \Lambda_{\text{QCD}}!$$

Modern view: EFT/Factorization

$$\mathcal{L} = \sum_n \frac{1}{m^n} c_n O_n \quad c(\nu) = \bar{c} + \sum_{n=0}^{\infty} c_n \alpha_s^{n+1}.$$

The Wilson coefficients are believed to be asymptotic: $c_n \sim n!$

IF SO such behavior should comply with the Operator Product Expansion.

EFT/factorization definition of renormalon: Asymptotic behavior of the perturbative expansion such that the associated ambiguity in the summation of the perturbative series can be absorbed into a higher order operator.

Example:

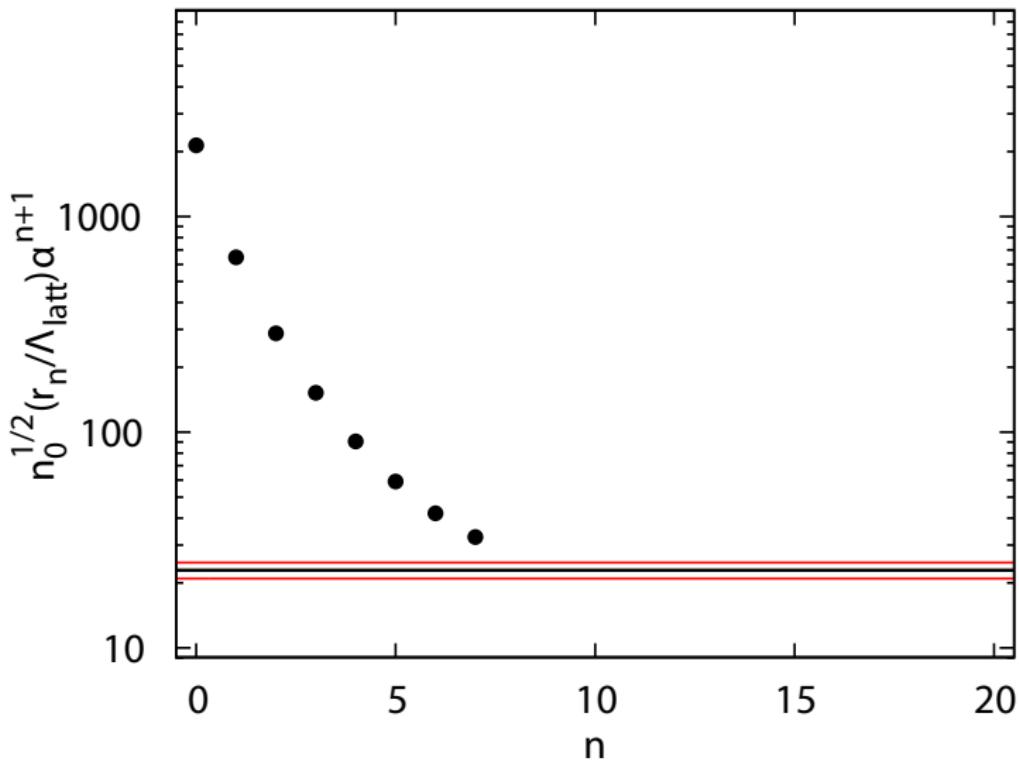

$$M_B = m_{\text{OS}} + \bar{\Lambda}_B + \mathcal{O}(1/m_{\text{OS}})$$

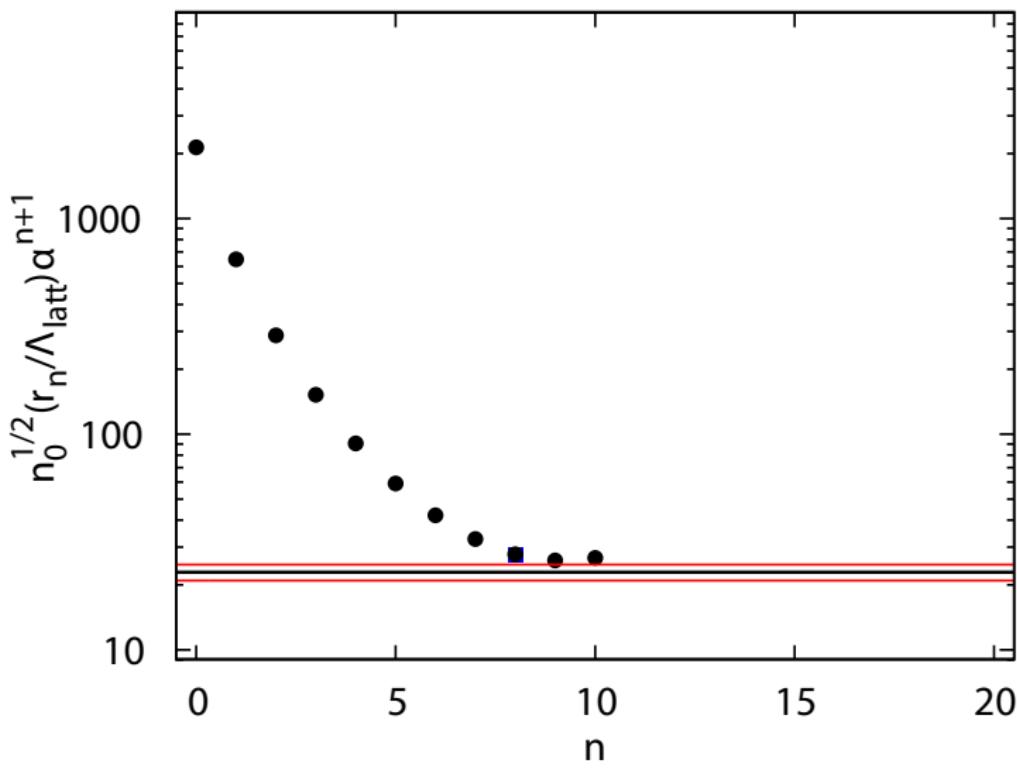

M_B is renormalon free. Therefore m_{OS} suffers from renormalon ambiguities:

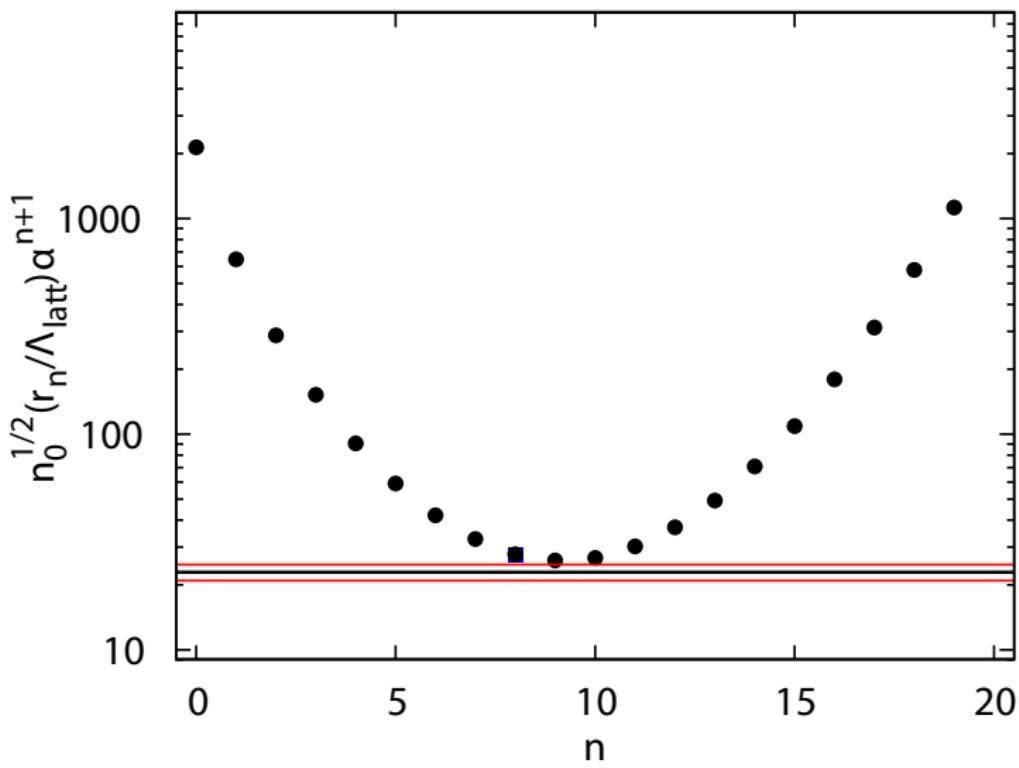

$$m_{\text{OS}} = m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots)$$

with $B_n \sim n!$. In other words

$$\delta_{np}^{(\text{pert.})} m_{\text{OS}} = \delta_{np}^{(\text{pert.})} m_{\overline{\text{MS}}} (1 + B_1 \alpha_s + B_2 \alpha_s^2 + \dots) \sim \Lambda_{\text{QCD}}!$$

Maximal accuracy of the Wilson coefficients from a perturbative calculation is (roughly) of the order of

$$\delta c \sim r_{n^*} \alpha_s^{n^*},$$

where $n^* \sim \frac{a}{\alpha_s}$. If a is positive c suffers from a non-perturbative ambiguity of order

$$\delta c \sim (\Lambda_{\text{QCD}})^{\frac{|a|\beta_0}{2\pi}}.$$

The Borel transform of $c(\nu)$ reads

$$B[c](t) \equiv \sum_{n=0}^{\infty} c_n \frac{t^n}{n!},$$

and c is written in terms of its Borel transform as

$$c = \bar{c} + \int_0^{\infty} dt e^{-t/\alpha_s} B[c](t).$$

The ambiguities in the Wilson coefficient ($c_n \sim n!$) reflects in poles in the Borel transform. If we take the one closest to the origin,

$$\delta B[c](t) \sim \frac{1}{a-t},$$

where a is a positive number.

Maximal accuracy of the Wilson coefficients from a perturbative calculation is (roughly) of the order of

$$\delta c \sim r_{n^*} \alpha_s^{n^*},$$

where $n^* \sim \frac{a}{\alpha_s}$. If a is positive c suffers from a non-perturbative ambiguity of order

$$\delta c \sim (\Lambda_{\text{QCD}})^{\frac{|a|\beta_0}{2\pi}}.$$

The Borel transform of $c(\nu)$ reads

$$B[c](t) \equiv \sum_{n=0}^{\infty} c_n \frac{t^n}{n!},$$

and c is written in terms of its Borel transform as

$$c = \bar{c} + \int_0^{\infty} dt e^{-t/\alpha_s} B[c](t).$$

The ambiguities in the Wilson coefficient ($c_n \sim n!$) reflects in poles in the Borel transform. If we take the one closest to the origin,

$$\delta B[c](t) \sim \frac{1}{a-t},$$

where a is a positive number.

Where do we expect renormalon effects to be more important?

Current-current correlator ($c_{n^*} \alpha_s^{n*+1} \sim \Lambda_{\text{QCD}}^4 / Q^4 \rightarrow c_n \sim n!$):

$$\int d^4x e^{iqx} \langle \text{vac} | J(x) J(0) | \text{vac} \rangle = (\text{Pert. th.}) + \frac{\Lambda_{\text{QCD}}^4}{Q^4} + \dots$$

Plaquette:

$$\langle P \rangle = (\text{Pert. th.}) + a^4 \Lambda_{\text{QCD}}^4 + \dots$$

DIS:

$$(\text{Pert. th.}) + \frac{\Lambda_{\text{QCD}}^2}{Q^2} + \dots$$

Heavy quark physics:

$$(\text{Pert. th.}) + \frac{\Lambda_{\text{QCD}}}{m_Q} + \dots$$

The natural place to look for these effects.

Check : $r_n \xrightarrow{n \rightarrow \infty} m_{\overline{\text{MS}}} \left(\frac{\beta_0}{2\pi} \right)^n n! N_m \sum_{s=0}^n \frac{\ln^s [\nu / m_{\overline{\text{MS}}}] }{s!} \sim \nu$

Determination of N_m

$$\nu \sim m$$

Large β_0 analysis

$$m \left(\frac{\nu}{m} \right)^{2u} \simeq \nu \{ 1 + (2u - 1) \ln \frac{\nu}{m} + \dots \}.$$

Therefore, the underlying assumption is that we are in a regime where (besides $2u - 1 \ll 1$)

$$(2u - 1) \ln \frac{\nu}{m} \ll 1.$$

$$N_m = \frac{r_n}{(r_n^{\text{asym}} / N_m)}$$

Determination of N_m

$$\nu \sim m$$

Large β_0 analysis

$$m \left(\frac{\nu}{m} \right)^{2u} \simeq \nu \{ 1 + (2u - 1) \ln \frac{\nu}{m} + \dots \}.$$

Therefore, the underlying assumption is that we are in a regime where (besides $2u - 1 \ll 1$)

$$(2u - 1) \ln \frac{\nu}{m} \ll 1.$$

$$N_m = \frac{r_n}{(r_n^{\text{asym}} / N_m)}$$

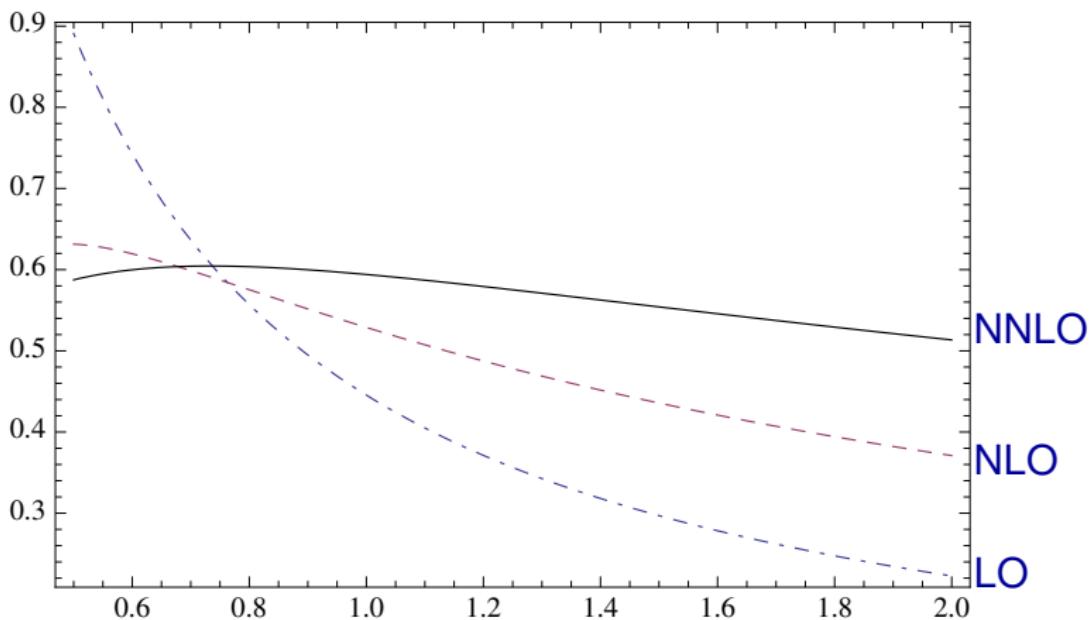

Figure: N_m for $n_l = 3$, as a function of $x \equiv \mu/m_b$, obtained from r_n/r_n^{asym} with r_n^{asym} truncated at $\mathcal{O}(1/n^3)$. We name the different lines as LO (dashed-dotted), NLO (dashed) and NNLO (solid) for $n = 0, 1, 2$, respectively.

The static potential

$$V(r; \nu_{us}) = \sum_{n=0}^{\infty} V_n \alpha_s^{n+1},$$

$2m_{\text{OS}} + V$ can be understood as an observable up to $O(r^2 \Lambda_{\text{QCD}}^3, \Lambda_{\text{QCD}}^2/m)$ contributions $\rightarrow 2N_m + N_V = 0$ and

$$V_n^{\text{asym}} = N_V \nu \left(\frac{\beta_0}{2\pi} \right)^n \frac{\Gamma(n+1+b)}{\Gamma(1+b)} \left(1 + \frac{b}{(n+b)} c_1 + \frac{b(b-1)}{(n+b)(n+b-1)} c_2 + \dots \right)$$

$$N_V = \frac{V_n}{(V_n^{\text{asym}}/N_V)}$$

The static potential

$$V(r; \nu_{us}) = \sum_{n=0}^{\infty} V_n \alpha_s^{n+1},$$

$2m_{\text{OS}} + V$ can be understood as an observable up to $O(r^2 \Lambda_{\text{QCD}}^3, \Lambda_{\text{QCD}}^2/m)$ contributions $\rightarrow 2N_m + N_V = 0$ and

$$V_n^{\text{asym}} = N_V \nu \left(\frac{\beta_0}{2\pi} \right)^n \frac{\Gamma(n+1+b)}{\Gamma(1+b)} \left(1 + \frac{b}{(n+b)} c_1 + \frac{b(b-1)}{(n+b)(n+b-1)} c_2 + \dots \right)$$

$$N_V = \frac{V_n}{(V_n^{\text{asym}}/N_V)}$$

The static potential

$$V(r; \nu_{us}) = \sum_{n=0}^{\infty} V_n \alpha_s^{n+1},$$

$2m_{\text{OS}} + V$ can be understood as an observable up to $O(r^2 \Lambda_{\text{QCD}}^3, \Lambda_{\text{QCD}}^2/m)$ contributions $\rightarrow 2N_m + N_V = 0$ and

$$N_V = \frac{V_n}{(V_n^{\text{asym}}/N_V)}$$

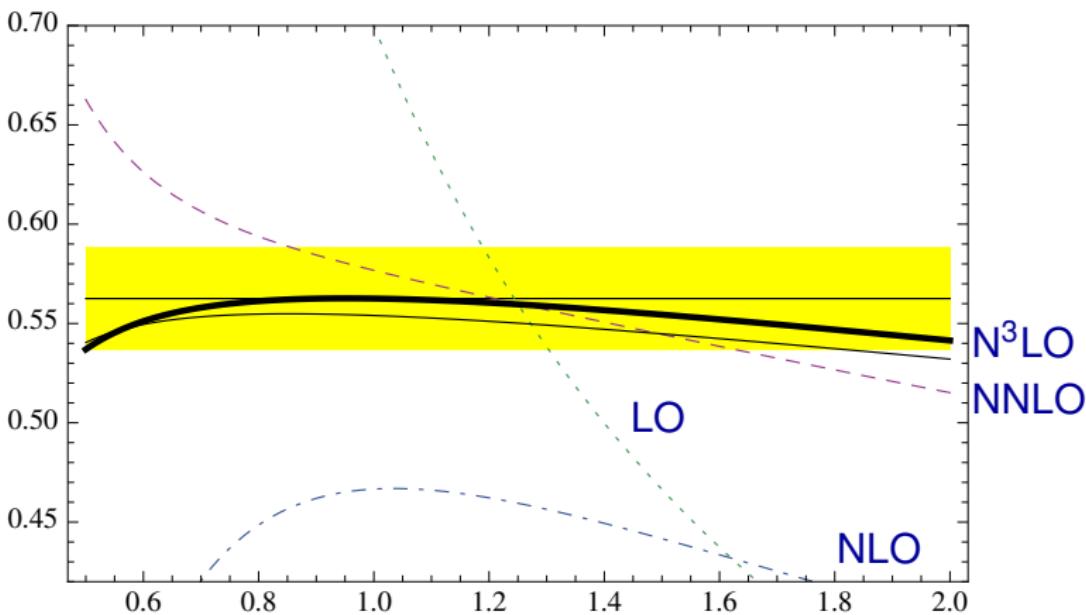

Figure: $-N_V/2 = N_m$ for $n_l = 3$, as a function of $x \equiv \nu r$, obtained from $-(N_V/2)v_n/v_n^{\text{asym}}$. v_n^{asym} is truncated at $\mathcal{O}(1/n^3)$.

$$N_m(n_l = 0) = 0.600(29),$$

$$N_m(n_l = 3) = 0.563(26).$$

~ 20 standard deviations from zero!

Conformal window: n_l dependence

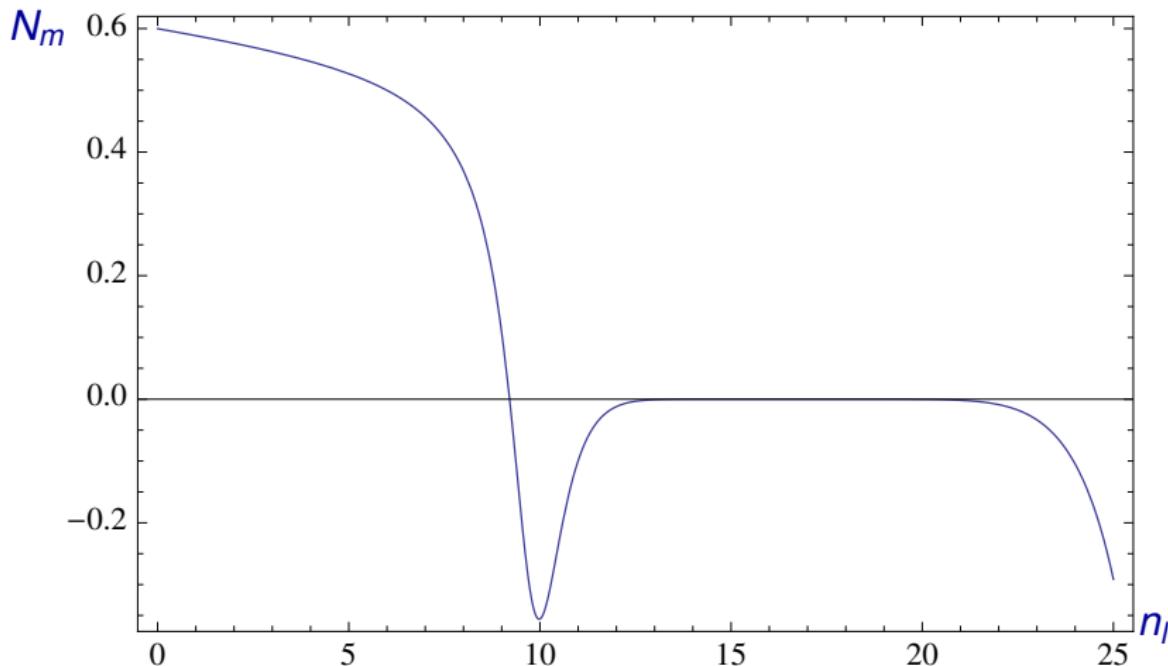

Figure: $N_m(x = 1)$ obtained from $-(N_V/2)v_3/v_3^{\text{asym}}$ as a function of n_l .

First numerical evidence of the disappearance of the renormalon in the conformal window.

Yet...

- ▶ Not possible to compute using known semiclassical analysis.
- ▶ Based on few orders in perturbation theory ($\sim 3, 4$)
- ▶ Claims against renormalon existence (Suslov), or against renormalon relevance (implicit in sum rules).

We would like to have a proof (at the same level of existing proofs of a linear potential at long distances), beyond any reasonable doubt, of the existence of the renormalon in QCD.

Determination of the gluon condensate: $\frac{1}{a} \gg \Lambda_{\text{QCD}} \gg \frac{1}{Na}$

$$\langle G^2 \rangle_{\text{NP}} = \frac{36 C_G^{-1}(\alpha)}{\pi^2 a^4(\alpha)} [\langle P \rangle_{\text{MC}}(\alpha) - S_P(\alpha)] + \mathcal{O}(a^2 \Lambda_{\text{QCD}}^2).$$

$$S_P(\alpha) \equiv S_{n_0}(\alpha), \quad \text{where} \quad S_n(\alpha) = \sum_{j=0}^n p_j \alpha^{j+1}.$$

$n_0 \equiv n_0(\alpha)$ is the order for which $p_{n_0} \alpha^{n_0+1}$ is minimal.

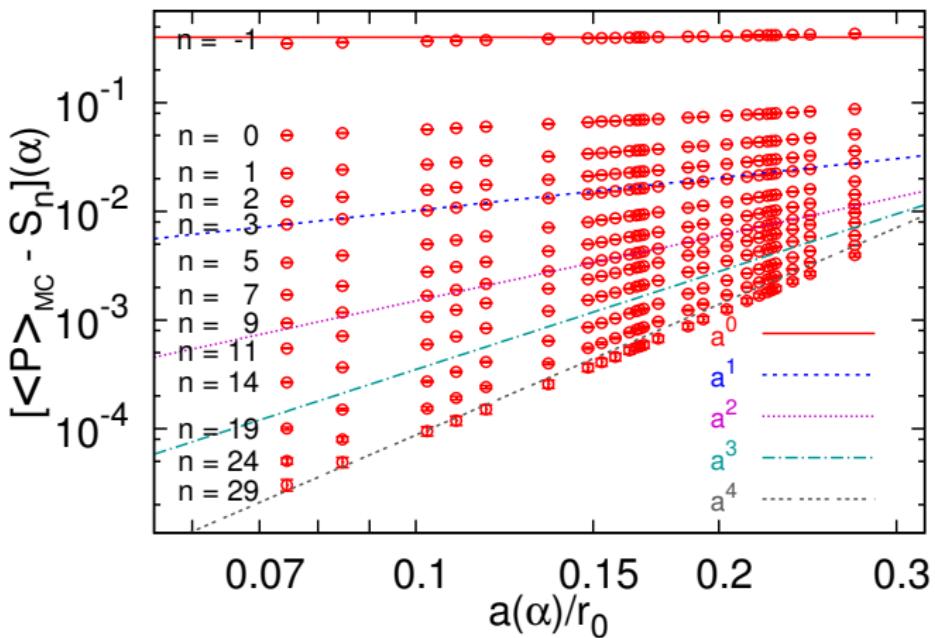

Figure: $\langle P \rangle_{\text{MC}}(\alpha) - S_n(\alpha)$ between MC data and sums truncated at orders α^{n+1} ($S_{-1} = 0$) vs. $a(\alpha)/r_0$. The lines $\propto a^i$ are drawn to guide the eye.

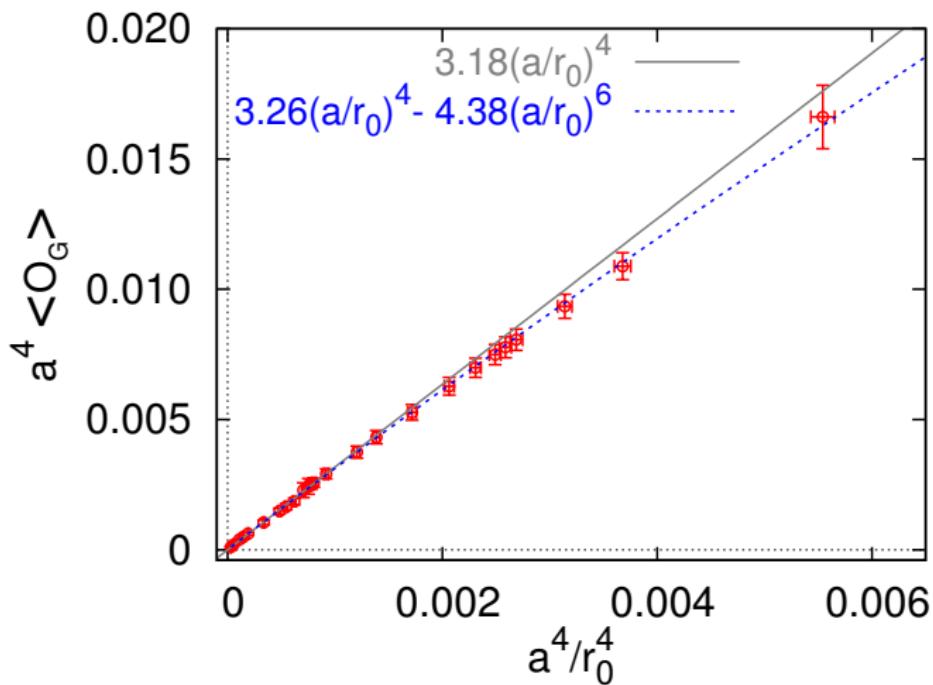

Figure: $\langle P \rangle_{\text{MC}}(\alpha) - S_P(\alpha)$. The linear fit is to $a^4 < 0.0013 r_0^4$ points only.

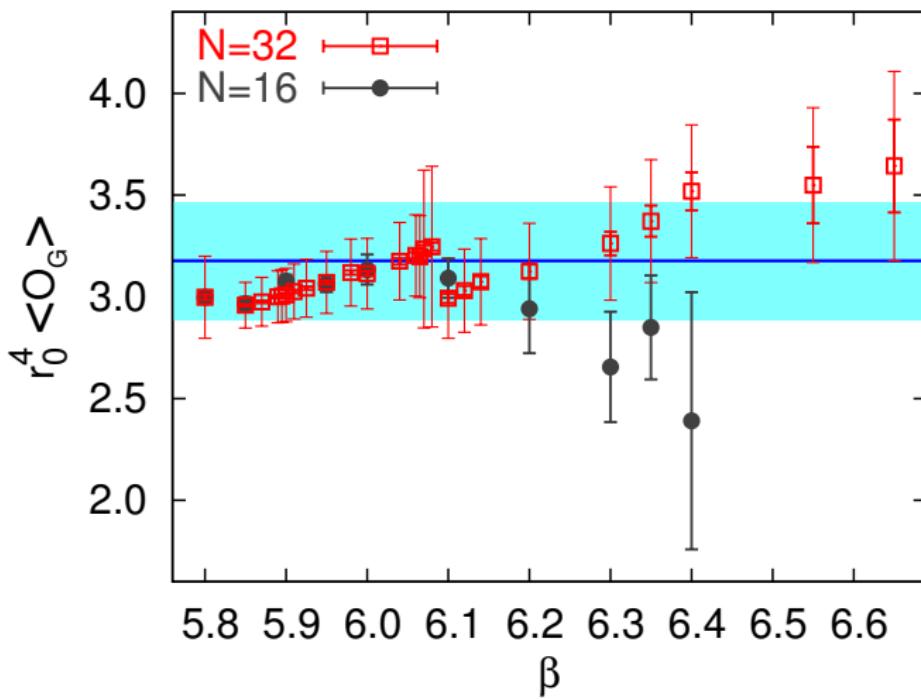

Figure: $\langle G^2 \rangle$ evaluated using the $N = 16$ and $N = 32$ MC data of Boyd et al. The error band is our prediction for $\langle G^2 \rangle$.

$$\langle G^2 \rangle = 3.18(29) r_0^{-4} = 24.2(8.0) \Lambda_{\overline{MS}}^4 \simeq 0.077 \text{ GeV}^4.$$

Uncertainty of the sum due to the truncation

$$\delta S_P = \sqrt{n_0} p_{n_0} \alpha^{n_0+1} \approx \frac{(2\pi)^{3/2} d^{1+db}}{2^{db} \beta_0 \Gamma(1+db)} N_P(\Lambda a)^4 \approx 12.06 N_P(\Lambda a)^4.$$

This object is scheme- and scale-independent (to $1/n$ -precision)

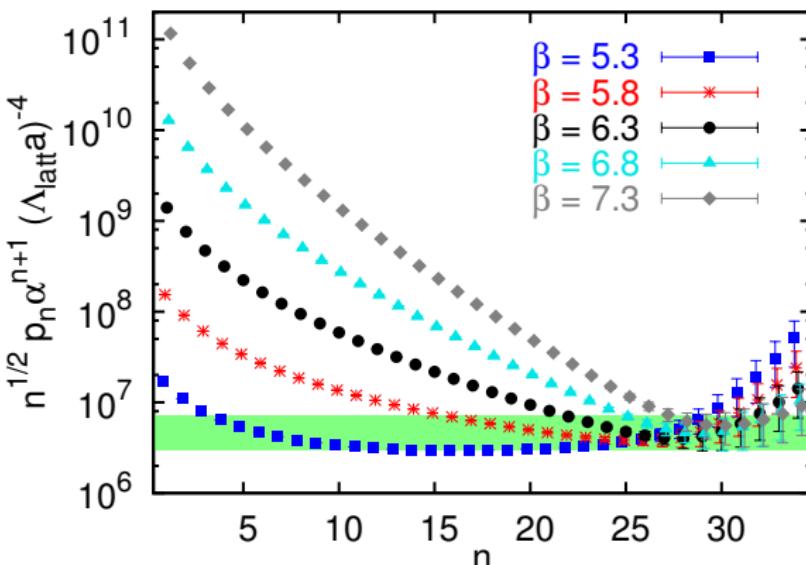

Figure: $\sqrt{n} p_n \alpha^{n+1} / (\Lambda_{latt} a)^4$, versus n for $\beta = 5.3, 5.8, 6.3, 6.8$ and 7.3 . The green band is the theoretical expectation $12.06 N_P = 5.1(2.1) \times 10^6$.

$$\sqrt{n_0} \frac{|r_{n_0}|}{\Lambda_{\text{latt}}} \alpha^{n_0+1}(\nu) = \frac{2^{3/2-b} \pi^{3/2}}{\beta_0 \Gamma(1+b)} |N_m| \approx 1.206 |N_m|,$$

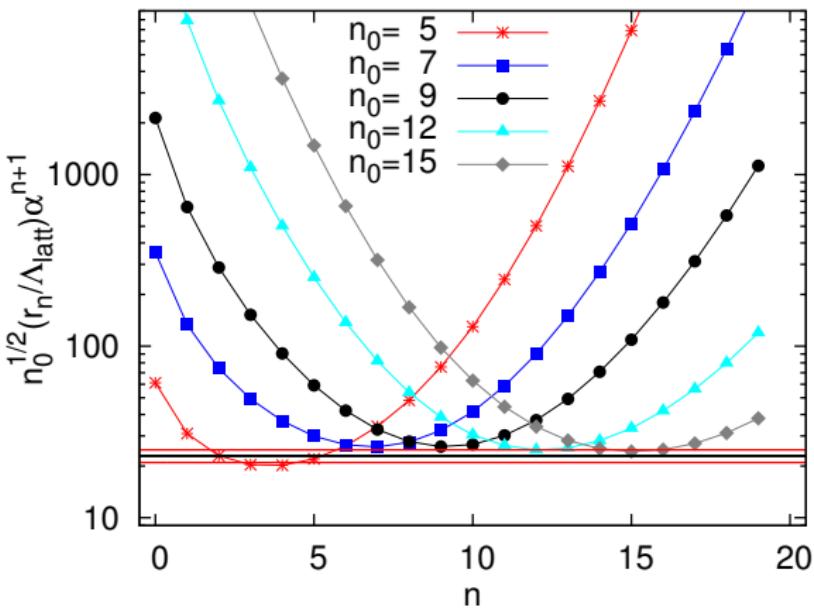

Figure: c_n times $\sqrt{n_0}$, for five different values of the lattice scheme coupling constant α , ranging from $\alpha(\nu) \approx 0.096$ ($n_0 = 5$) to $\alpha(\nu) \approx 0.036$ ($n_0 = 15$).

$$\delta \langle G^2 \rangle_{\text{NP}} \simeq \frac{(2\pi)^{3/2} d^{1+db}}{2^{db} \beta_0 \Gamma(1+db)} N_G^{\overline{\text{MS}}} \Big|_{n_f=0} \Lambda_{\overline{\text{MS}}}^4 = 27(11) \Lambda_{\overline{\text{MS}}}^4 \sim 0.087 \text{ GeV}^4.$$

$$\langle G^2 \rangle = 3.18(29) r_0^{-4} = 24.2(8.0) \Lambda_{\overline{\text{MS}}}^4 \simeq 0.077 \text{ GeV}^4.$$

CONCLUSIONS

Renormalons go beyond large- β_0 analysis: \rightarrow (NP)OPE

Strong evidence of renormalon dominance in heavy quark physics from $\mathcal{O}(\alpha^{3/4})$ $\overline{\text{MS}}$ -like computations: Pole mass, static potential, ...

$$N_m^{\overline{\text{MS}}}(n_l = 0) = 0.600(29), \quad N_m^{\overline{\text{MS}}}(n_l = 3) = 0.563(26).$$

Lattice: For the first time it was possible to follow the factorial growth of the coefficients over many orders, from around α^9 up to α^{20} , vastly increasing the credibility of the prediction.

$$N_m^{\overline{\text{MS}}}(n_l = 0) = 0.620(35), \quad C_F/C_A N_\Lambda^{\overline{\text{MS}}}(n_l = 0) = -0.610(41).$$

Two independent determinations with very different systematics.

We have (numerically) proven, beyond any reasonable doubt (~ 20 standard deviations!), the existence of the renormalon in QCD.

RENORMALON OK

First evidence of disappearance of renormalon in the conformal window.

CONCLUSIONS

The static singlet potential

The introduction of renormalons allows to obtain agreement between lattice simulations and perturbation theory.

$$E_s = 2m_{\text{OS}} + V_{s,\text{OS}} + \mathcal{O}(r^2)$$

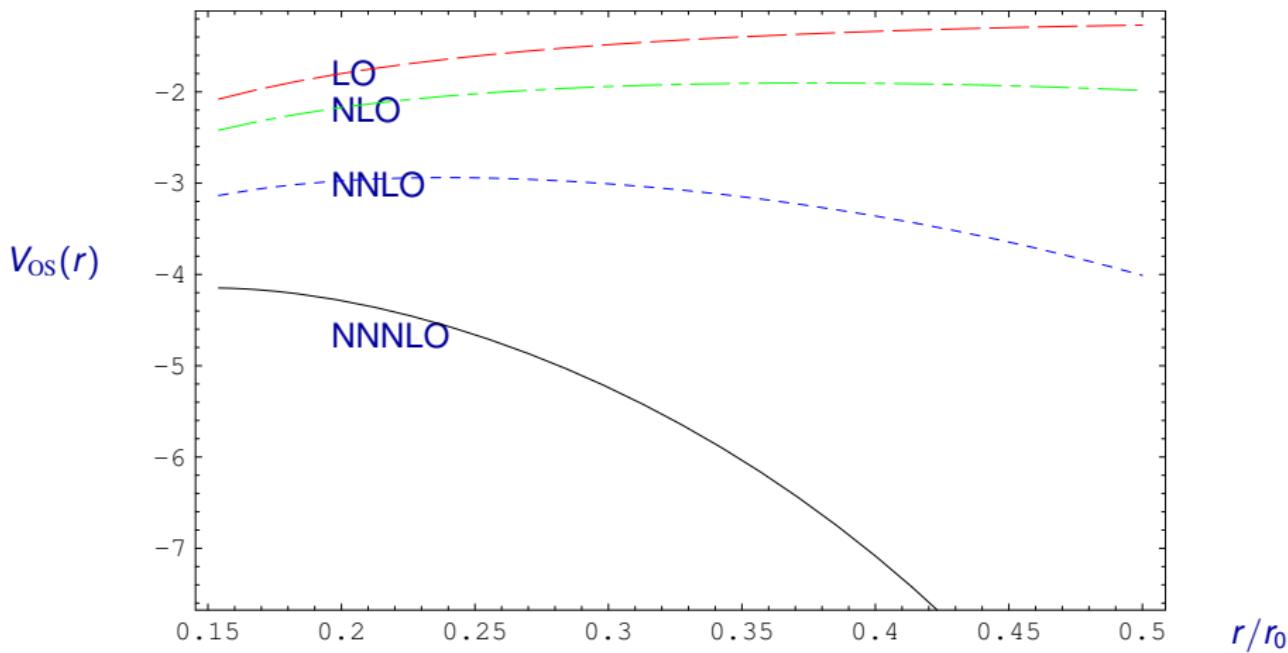

Figure: Plot of $V_{os}(r)$ at tree (dashed line), one-loop (dash-dotted line), two-loops (dotted line) and three loops (estimate) plus the RG expression for the ultrasoft logs (solid line). For the scale of $\alpha_s(\nu)$, we set $\nu = 1/r$. $\nu_{us} = 2.5 r_0^{-1}$.

$$V_{\text{OS}}(r) - V_{\text{OS}}(r') + E_{\text{latt.}}(r')$$

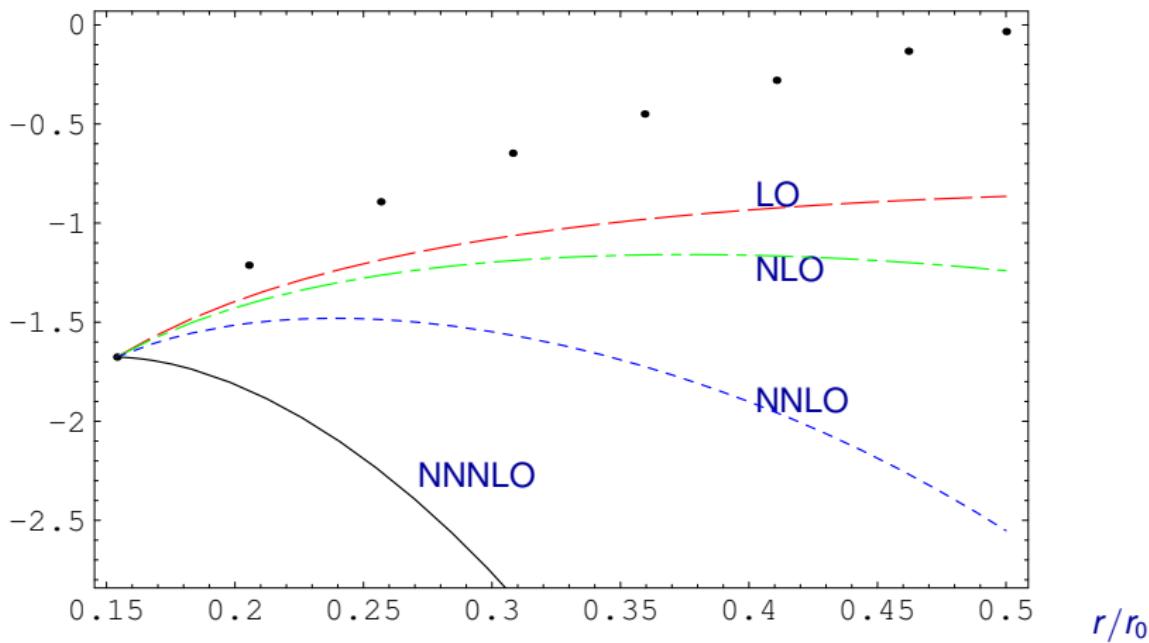

Figure: Plot of $V_{\text{OS}}(r) - V_{\text{OS}}(r') + E_{\text{latt.}}(r')$ versus r at tree (dashed line), one-loop (dash-dotted line), two-loops (dotted line) and three loops (estimate) plus the RG expression for the ultrasoft logs (solid line) compared with the lattice simulations of Necco and Sommer. For the scale of $\alpha_s(\nu)$, we set $\nu = 1/r$. $\nu_{\text{us}} = 2.5 r_0^{-1}$.

$$E_s = 2m_{\text{RS}}(\nu_f) + V_{s,\text{RS}}(\nu_f) + \mathcal{O}(r^2)$$

$$m_{\text{RS}}(\nu_f) = m_{\text{OS}} - \sum_{n=0}^{\infty} N_m \nu_f \left(\frac{\beta_0}{2\pi} \right)^n \alpha_s^{n+1}(\nu_f) \sum_{k=0}^{\infty} c_k \frac{\Gamma(n+1+b-k)}{\Gamma(1+b-k)}.$$

Expansion in $\alpha_s(\nu)$

$$m_{\text{RS}}(\nu_f) = m_{\overline{\text{MS}}} + \sum_{n=0}^{\infty} r_n^{\text{RS}} \alpha_s^{n+1},$$

where $r_n^{\text{RS}} = r_n^{\text{RS}}(m_{\overline{\text{MS}}}, \nu, \nu_f)$. They are the ones expected to be of natural size. We now do not lose accuracy if we first obtain m_{RS} and later on $m_{\overline{\text{MS}}}$.

$$V_{s,\text{RS}(\text{RS}')}^{(0)}(\nu_f) = V_s^{(0)} + 2\delta m_{\text{RS}(\text{RS}')},$$

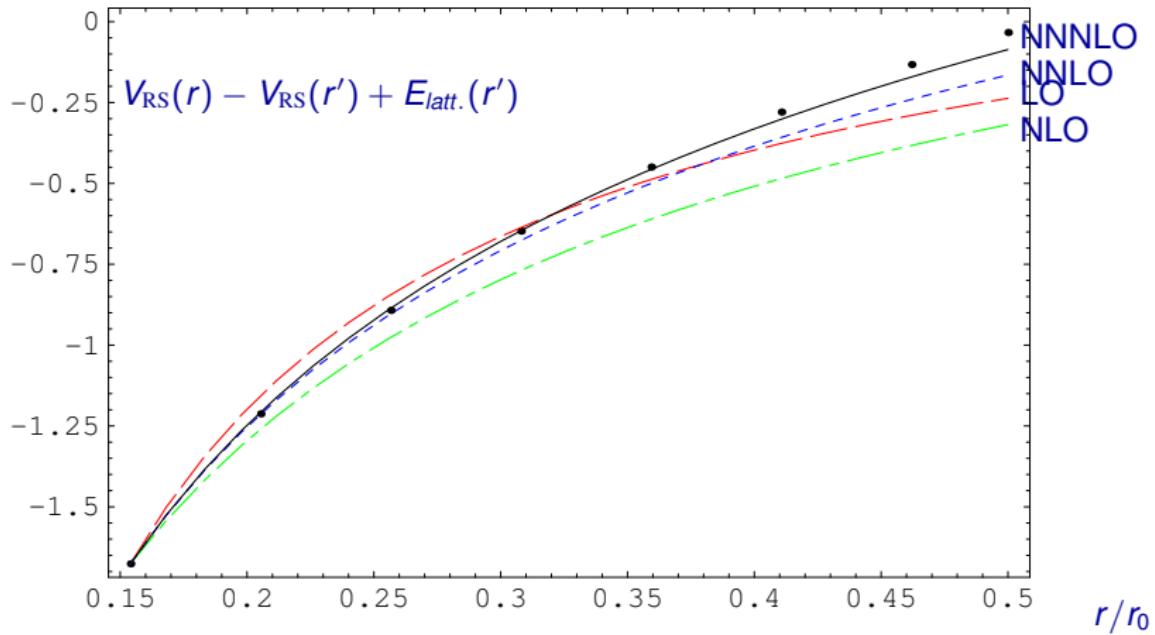

Figure: Plot of $V_{RS}(r) - V_{RS}(r') + E_{latt.}(r')$ versus r at tree (dashed line), one-loop (dash-dotted line), two-loops (dotted line) and three loops (estimate) plus the leading single ultrasoft log (solid line) compared with the lattice simulations of Necco and Sommer. For the scale of $\alpha_s(\nu)$ $\nu = \text{constant}$. $\nu_{us} = 2.5 r_0^{-1}$.

$$V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r')$$

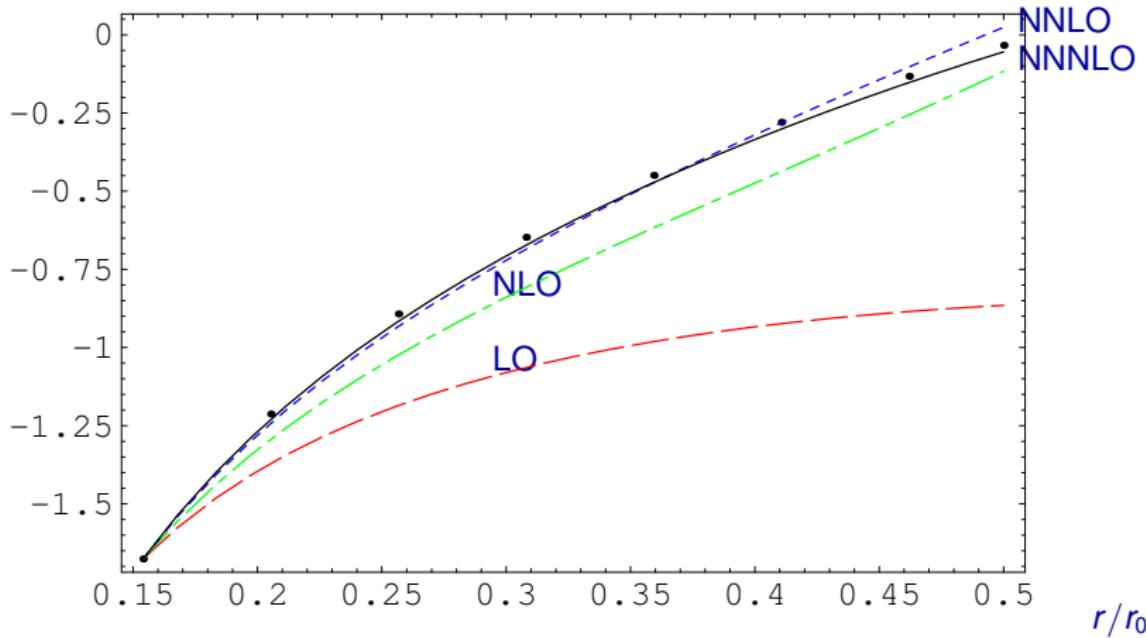

Figure: Plot of $V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r')$ versus r at tree (dashed line), one-loop (dash-dotted line), two-loops (dotted line) and three loops (estimate) plus the RG expression for the ultrasoft logs (solid line) compared with the lattice simulations of Necco and Sommer. For the scale of $\alpha_s(\nu)$, we set $\nu = 1/r$. $\nu_f = \nu_{\text{us}} = 2.5 r_0^{-1}$.

$$V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r')$$

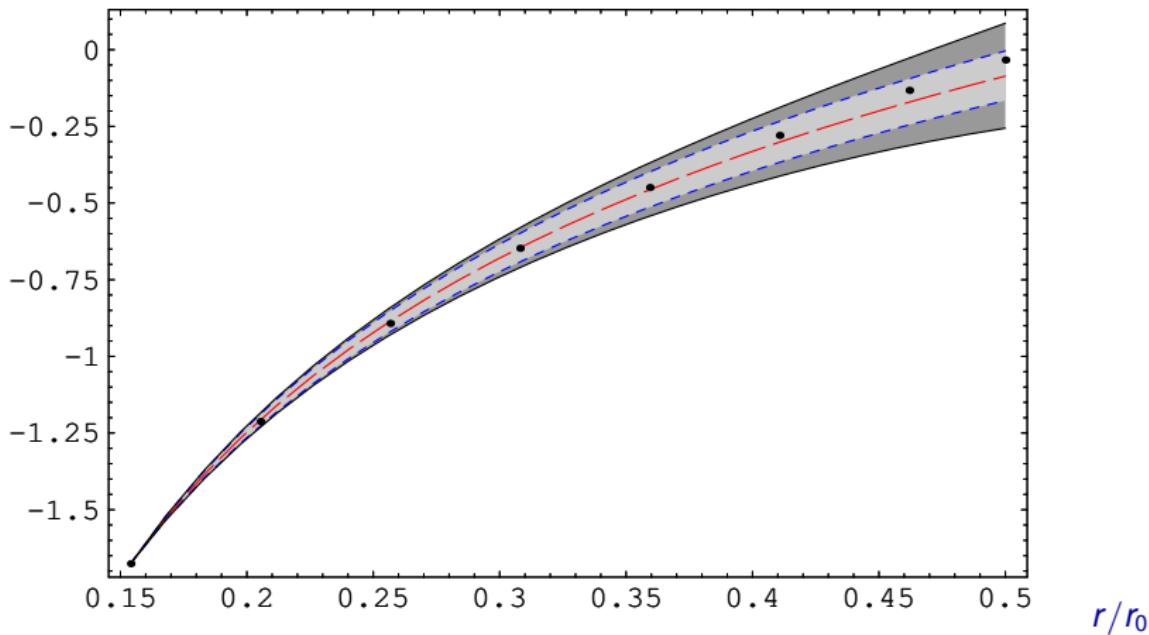

Figure: Plot of $V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r')$ versus r at tree (dashed line), one-loop (dash-dotted line), two-loops (dotted line) and three loops (estimate) plus the leading single ultrasoft log (solid line) compared with the lattice simulations of Necco and Sommer. For the scale of $\alpha_s(\nu)$ $\nu = \text{constant}$. $\nu_{us} = 2.5 r_0^{-1}$.

$$V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r') + \sigma(r - r')$$

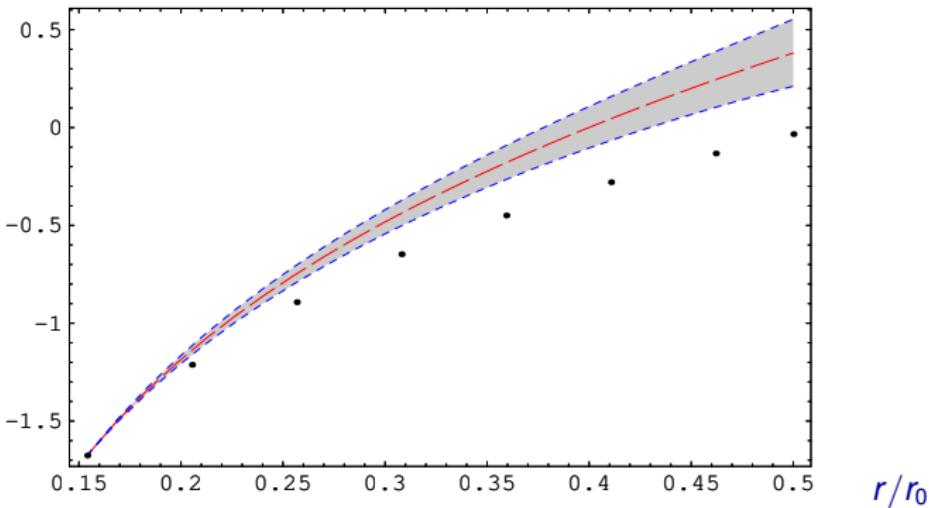

Figure: Plot of $V_{\text{RS}}(r) - V_{\text{RS}}(r') + E_{\text{latt.}}(r') + \sigma(r - r')$ versus r at three loops (estimate) with the leading ultrasoft log compared with the lattice simulations of Necco and Sommer. For the scale of $\alpha_s(\nu)$, we set $\nu = \text{constant}$. $\sigma = 1.35 r_0^{-2}$ and $\nu_{us} = 2.5 r_0^{-1}$.

- 1) Perturbation theory works very well for energies above 1 GeV (Pineda; Sumino, Recksiegel; Lee (Necco, Sommer for the force)).
- 2) Constraint on the size of nonperturbative effects for heavy quarkonium.
- 3) A linear non-perturbative potential at short distances is ruled out.
